TITLE: Investigation of the properties of various complex esters as technological lubricants for the cold rolling of carbon and special steels

SOURCE: Fiz.-khim. zakonomernosti deystviya smazok pri obrabotke metallov davleniyem. Moscow, Izd-vo AN SSSR, 1963, 102-109

TOPIC TAGS: lubricant, cold rolling, steel, complex ester, petrolatum, carbon steel, steel rolling

ABSTRACT: The effect of the structure of some synthetic esters upon their effectiveness as lubricants for the cold rolling of 08KP, 33A 1Kh18N9T, and VG98 steel has been investigated. The effectiveness of the lubricant was evaluated on the basis of measurements during several rolling operations with constant adjustment of the rollers. Thus, the distance of the top roller was reduced after each operation to provide constant pressure. There was found to be a direct linear relationship between band thickness and the pressure of the metal on the roller. The

Card

ACCESSION NR: AT4014065

effectiveness of various tested esters and natural oils is shown in Figure 1 of the Enclosure. Similar curves were obtained for various hydrocarbon lubricants and mixtures of technical petrolatum with the triethyleneglycol esters of the C17-C21 acids. It is concluded that the effectiveness of an ester increases proportionally with the length of the molecule. The type of alcohol and length of its molecule do not affect the lubrication properties of the ester, but do affect the melting point. Branches, chains and cyclic groups decrease the lubrication effectiveness of the esters. The presence of oleic acid in the lubricant increases the antiscratching property of the lubricant. The most effective esters proved to be those from the dibasic alcohols and the synthetic C17-C21 fatty acids containing antiscratching admixtures. The butyl ester of stearic acid was better than palm oil, while the technological properties of the simple hydrocarbons were worse than those of palm oil. The friction coefficient of any lubricant may be increased by dilution with a less effective one. "The work was carried out under the direction of I. M. Pavlov, corr. member of the AN SSSR." AUTHORS: Burtsev, V. A., Stolov, A. M., Shakhov, V. V.TITLE: Measurement of the Energy Flux Emitted by Plasma in  
"Al'fa" Research InstallationPERIODICAL: Zhurnal tekhnicheskoy fiziki, 1960, Vol. 30, No. 12,  
pp. 1415 - 1421

TEXT: For measuring the energy emitted from the walls of the discharge chamber, a spherical black body with a low thermal capacity and an absorption coefficient of nearly unity was used. By means of this black body only measurements of the total energy emission could be made, because its time lag was too great. For measuring the time dependence of the energy fluxes, a plane pickup (bismuth thermocouple) was used. The signals of the two pickups were made visible by an oscilloscope. The measurements showed that the apparatus used here records not only that part of the energy which is introduced into the plasma. It is assumed that by arc discharges a considerable part of energy is liberated by local emissions, and also a loss occurs as a result of oscillations of

SOURCE: AN SSSR. Institut goryuchikh iskopayemykh. Novyye metody zhiganiya topliv i voprosy teorii goreniya (New methods in the combustion of fuels and problems in the theory of combustion). Moscow, Izd-vo Nauka, 1965, 166-172

TOPIC TAGS: combustion, phosphorus, phosphorus compound

ABSTRACT: The conditions were studied under which the combustion of a hydrocarbon fuel containing an organic phosphorus compound yields a maximum of  $P_4O_{10}$ . The experiments were conducted by analyzing the combustion products obtained with a hydrocarbon fuel containing either 9 or 30% phosphoric acid ester. A combustion chamber equipped with a fuel atomizer and a scrubber for the retention of combustion products was used. The experiments showed that the highest yield is obtained at an air excess factor of 1.2-1.5. The thermodynamics of reactions at various temperatures are discussed. The experiments are of interest for the combustion of compounds containing phosphorus and for the new methods used in phosphoric acid production. Orig art. has: 3 figures. [PV]

TITLE: Unsteady state diffusion of a magnetic field in a plasma cooled by solid walls

SOURCE: AN SSSR. Izvestiya. Mekhanika zhidkosti i gaza, no. 4, 1966, 3-8

TOPIC TAGS: plasma diffusion, magnetic field, magnetohydrodynamics

ABSTRACT: The aim of the work was an evaluation of the role of heat conductivity in the diffusion process of a magnetic field in a plasma. The analysis starts with a solution of the linear problem in a cylindrical conductor without taking heat conductivity into account. The problem is solved by the method of integral relationships and by the method of the expansion of the first. There follows an analysis of the maximum permissible time of processes where the cooling does not yet affect the plasma moving in the center of the tube. Finally, the article solves the problem of the diffusion of a magnetic field in a plasma cooled by walls. All the investigations were carried out on the assumption that the processes are one-dimensional, that is, the diffusional and thermal layers are assumed to be

Time to establish a constant rate of fusion of a semi-  
infinite solid body

PERIODICAL: Inzhenernyy zhurnal, v.2, no.4, 1962, 237-244  
TEXT: Protection against kinetic heating requires a theory  
of mass removal (ablation) from the surface of the body. Previous  
analytical and experimental studies of the non-stationary process  
of ablating bodies have shown that the steady-state rate of  
melting becomes established rather slowly. Neglecting the non-  
steady nature of the process leads to substantial errors in  
predicting the rate of the process rather slowly. If the heat flow at  
the instant of the appearance of the boundary of the structure of the flying object  
with the heat flow at the boundary of the melting body, starting  
that its variation during the time interval before the establishment  
of a steady rate is insignificant, then the non-stationary  
rate of the process mainly affects the time interval before the  
fusion process can be considered

quasi-steady. This case is studied in the present paper. The integral equations of the Stefan problem as formulated by L. I. Rubinshteyn (Dokl. AN SSSR, v.58, no.2, 1947) are used. It is assumed that the fused material is immediately withdrawn. Approximate expressions for the rate of fusion and the rate of heat removal into the body are obtained which are asymptotic solutions of the integral equations for large values of time. An advantage over the method of H. G. Landau (Heat conduction in a melting solid. Quart.Appl.Math., v.VIII, no.1, 1950) is that here the initial conditions are unrestricted and the analytical form of the solution obtained permits a fairly simple assessment of the effects of initial conditions on the time of establishment of the steady state. In the vicinity of the front stagnation point of a blunt body in a high temperature gas flow, when the substance of the body has a pronounced melting point lower than the stagnation temperature, heating occurs until the melting point is reached, which instant is defined as the origin of time. The flow around the body is stationary after fusion has commenced. The solid body is considered semi-infinite and the heat propagation in it is unidimensional. Since three phases are considered,

Card 2/3

Time to establish a constant ...

S/258/62/002/004/006/019  
E191/E535

many boundary conditions have to be fulfilled. The problem is simplified when the two products of viscosity and density and of heat conductivity and density are equal in the gas and the liquid phases and when the liquid layer is very thin. The heat flow is considered stationary and known. The basic equations are formulated and the method of solution is discussed. Graphs are given to determine the duration of the transient period. The response of the fusion rate to a sudden change in the heat flow is analysed. There are 3 figures.

AUTHOR: Shakhov, Ye. M. (Moscow)

TITLE: Integral equations for the problem of nonsteady state fusing of vitreous materials

SOURCE: Inzhenernyy zhurnal, v. 4, no. 2, 1964, 251-253

TOPIC TAGS: nonsteady state fusing, vitreous film, nonstationary problem, aerodynamic heating, blunt body, Stefan problem, incompressible fluid, viscous fluid

ABSTRACT: The author makes certain simplifying assumptions in the problem of one dimensional nonstationary fusing of a vitreous film at the front of a blunt body which is subject to aerodynamic heating. He reduces the system of differential equations for the problem to a system of integral equations which are analogous to those for the classical Stefan problem. The following assumptions are made: the material is an incompressible viscous fluid, the viscosity of which falls sharply with temperature increase. Within the body the viscosity is infinite, the coefficient of heat conductivity is constant, the flow around the body and the flow in the boundary layer are quasistationary. The inertial terms in the equation of

Card 1/2

ACCESSION NR: AP4037097

quantity of motion for flow of the fluid film are negligible. In the system of coordinates referred to a fixed solid body at infinity, the effect of convective heat transfer on the temperature of the surface and the fusion rate is negligibly small, and the temperature across the fluid film is distributed linearly. Via an asymptotic expansion the author concludes that the fusion rate does not depend on the temperature distribution in the material. He reduces the problem to the solution of the heat equation in a certain region with unknown boundaries whose rate of advancement depends on time and temperature at this boundary and does not depend on the temperature distribution within the body. The temperature distribution is found by computation of integrals. Orig. art. has: 10 formulas.

TITLE: Viscous heat-conducting gas flow in a hypersonic shock wave

SOURCE: Inzhenernyy zhurnal, v. 4, no. 4, 1964, 646-649

TOPIC TAGS: hypersonic flow, shock wave, viscous flow, heat conducting gas, viscosity power law

ABSTRACT: The influence of the Prandtl number and, in particular, viscosity on the structure of a shock wave is analyzed. It is shown that the character of the asymptote near the surface of discontinuity holds for any Prandtl number. Differential equations for continuity, momentum, and energy, are integrated with respect to any parameter of the incident flow, assuming that the Prandtl number is equal to 3/4 and that viscosity obeys either the Sutherland Law or a power law with an exponent of 1/2. An expression for a nondimensional-velocity profile with arbitrary parameters of incident flow is established, although temperature, density, and pressure are obtained by using

Card 1/2

L 14803-65

AUTHOR: Shakhov, Ye. M. (Moscow)

TITLE: Temperature field in a solid body with nonuniformly heated surface

SOURCE: Prikladnaya matematika i mehanika, v. 28, no. 1, 1964, 188-192

TOPIC TAGS: temperature field, nonuniform heating, aerodynamic heating, heat propagation, heat flow, critical point, Fourier integral, Fourier Bessel integral, Green's function

ABSTRACT: The author studies aerodynamic heating of a body in a neighborhood of the leading critical point. He considers in particular the problem (plane  $\nu = 1$  and axisymmetric  $\gamma = 2$ ) of heating of a semi-infinite body  $y > 0$  with temperature  $T_{\infty}$  everywhere identical initially, with given normal derivative on the boundary

$$\frac{1}{\epsilon^2} \frac{\partial T}{\partial \epsilon} - \frac{\partial^2 T}{\partial r^2} + \frac{\nu - 1}{r} \frac{\partial T}{\partial r} + \frac{\partial T}{\partial y} = 0, \quad y = \infty, \quad T = T_{\infty}, \quad (1)$$
$$y = 0, \quad \frac{\partial T}{\partial y} = -T_{\infty}k(3 + \alpha e^{-\alpha y}), \quad r = 0, \quad \frac{\partial T}{\partial r} = 0.$$

Card 1/2

ACCESSION NR: AP4013396

This problem can be considered as a model for describing the process of heat propagation in the front part of a blunt body subjected to aerodynamic heating. The solution is sought in the form of a Fourier integral or a Fourier-Bessel integral. Suppose that a heat front moves with velocity  $V$  along the surface of the body half-space  $y > 0$  in the positive direction along the  $x$  axis. At time  $t = 0$  the front is in the plane  $x = 0$ . The body is divided by heat insulation along the plane  $x = 0$  into two quarter-spaces. The process of propagation in the body is determined in the region  $x > 0, y > 0$ . The solution is obtained with the aid of the Green's function. The author gives some asymptotic results. ABSTRACT: A new self-propelled saw for cutting trees (2-18 cm diameter) or dense growth (4-5 cm diameter) at a level of less than 10 cm above ground was developed at VNIIILM<sup>17</sup>. The power saw SMA-1 (see Fig. 1 on the Enclosure) consists of a frame 1, drive 2, engine 3 (from power saw "Druzhba"), worm reducer 4, clutch 6, chain drive 7, speed reducer 5, chain drive 8, clamp 10 (for clamping the sawing beam), guiding bars 11 and 12, pivot 13 (for turning the sawing beam through 90° in either direction), ratchet mechanism 14 and 15, controls 16 and 17, and gas tank 21. Two sawing attachments for cutting trees or dense growth can be used. The specifications of the SMA-1 are: weight 55 kg, fuel tank 1.5 liter, length 730 mm (without saw), width 200 mm at lower frame, 480 at handles, height 1000 mm,

TITLE: An approximate solution of the Cauchy problem for ordinary differential equations with a preassigned number of exact signs. I

PERIODICAL: Zhurnal vychislitel'noy matematiki i matematicheskoy fiziki, v. 3, no. 2, 1963, 239-253

TEXT: The bilateral difference method by Ronge-Cutt for the approximate solution of the ordinary differential equations allows a simple and exact estimate of errors and is easier than the similar method by Adams since it does not contain the "initial section." The present paper investigates the abovementioned method for the case of first order differential equations with an emphasis on the particularities related to approximate quadratures (the approach follows three steps: the evaluation of the quadratures, Cauchy's problem for one equation, and Cauchy's problem for a system of equations). The authors derive the bilateral methods for the first, second, and third order. Each pair of equations depends on two parameters whose choice specializes the method to suit any particular problem. Using the computer Strela of the Moscow State University Computing Center, the authors numerically calculated tables for the functions (1)  $y' = y$ ,  $y(0) = 1$  with the third order method; (2)  $y' = -y/x$ ,  $y(1) = 1$  with the second order method; (3) the Fresnel

ACCESSION NR: AP4037248

They describe coordinate-wise two-sided Runge-Kutta methods for approximate solution of (1) and give expressions for the remainder terms in the general case. They prove convergence of the Runge-Kutta methods, study the concept of measure of error of the approximate solution, and derive an effective estimate of the modulus of this measure. The conditions of computation under which the approximate solution is obtained with a given number of correct signs are explained, and some numerical results are given. This paper is a generalization of the authors' previous work (same title, No. I.). "The authors express their deep gratitude to A. N. Tikhonov, I. S. Berezin and D. A. Kveselav for their constant attention to the work." Orig. art. has: 4 tables and 20 formulas.

SOV/38-23-6-2/11

TITLE: On the Imitation of Simplest Markov Processes  
PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya matematicheskaya, 1959,  
Vol 23, Nr 6, pp 815-822 (USSR)

ABSTRACT: Let a homogeneous Markov process with discrete time and q states be given. The probability  $p_i$  that the particle is in the initial moment in the i-th state ( $i = 1, 2, \dots, q$ ) and the matrix  $\{p_{ij}\}$  of the transition probabilities are assumed to be known. The probability that for n experiments the given combination  $\Delta_n = \beta_1 \beta_2 \beta_3 \dots \beta_{n-1} \beta_n$  ( $1 \leq \beta_y \leq q$ ) arises, is  $\mu_{\Delta_n} = p_{\beta_1} p_{\beta_2} p_{\beta_3} \dots p_{\beta_{n-1}} p_{\beta_n}$ . Let  $E_n(q)$

be the set of all different numbers of n ciphers in the q-adic system. Let  $E'_n(q)$  be the set arising from  $E_n(q)$ , if

every number  $\Delta_n$  is repeated  $l^m$  times, where l and m are common denominators of the  $p_i$  and  $p_{ij}$ . Let a normal

Card 1/2

3

On the Imitation of Simplest Markov Processes

SOV/38-23-6-2/11

periodic system be defined according to Korobov [Ref 17].  
Theorem : Normal periodic systems on  $E_n^q(q)$  are possible if  
and only if it is

$$(2) p_1 = \sum_{i=1}^q p_i p_{i1}, p_2 = \sum_{i=1}^q p_i p_{i2}, \dots, p_{q-1} = \sum_{i=1}^q p_i p_{iq-1}$$

By means of normal periodic for  $E_n^q(q)$  the author constructs a  
normal sequence in the sense of Markov which is different  
from that given in (3).

TITLE: Field studies of aeromagnetometers AM-13 and AMM-13 ✓

SOURCE: Ref. zh. Geofizika, Abs. 11D188 10 24 24

REF SOURCE: Sb. Geofiz. priborostr. Vyp. 21. L., Nedra, 1964, 83-100

TOPIC TAGS: aerial survey, magnetometer, magnetic effect / AM-13 magnetometer, AMM-13 magnetometer, PPM magnetometer

ABSTRACT: In the course of aeromagnetic surveying of the northern Arctic Ocean in 1963, dissimilar relative ferrosonde magnetometers were simultaneously mounted in the IL-14 airplane. The magnetometers were AM-13, AMM-13, and the proton-precessional magnetometer PPM. A simultaneous utilization of two aeromagnetometers of the same type served to increase the reliability and accuracy of magnetic field measurements and made it possible to conduct comparative studies of the instrumental errors for the instruments working under identical conditions. A substantial drift of the zero reading in both the AM-13 and the AMM-13 was noted during work conducted under arctic conditions. This was caused mainly by the influence of the temperature. Making an exact allowance for the zero drift of the magnetometers was found possible only with the use of an absolute auxiliary apparatus. A lack of uniformity in the ribbon feed

pp 126-129

ABSTRACT: Au nuggets were removed by jiggling before flotation. The  
following flotation procedure was established: grinding 95 percent  
to -100 mesh; reagents consumed (in g/t): xanthate 100, frother  
20, pine oil 48; pH 7.0-8.0; soda consumed 0.5 kg/t. Flotation  
time 15 min. The employment of hydrocyclones in combination  
with flotation yielded no special effect. When the flotation con-  
centrate was cyanided with prior washing out of the reagents and  
with a cyanide concentration of up to 0.1 percent, 97.3 percent of  
the Au was recovered.

TITLE: Utilization of elements of mineral nutrition by Chlorella cells in intensive cultivation

SOURCE: AN SSSR. Otdeleniye biologicheskikh nauk. Problemy kosmicheskoy biologii, v. 4, 1965, 687-693

TOPIC TAGS: Chlorella, mineral, acid base equilibrium, plant growth, chemical composition, solution concentration

ABSTRACT: Experiments were performed to determine the mineral-salt requirements of a thermophytic strain of *Chlorella pyrenoidosa* S-39 in order to calculate the additions to the medium required during prolonged intensive culture. The cultures were grown in a Tamiya medium containing the following amounts of mineral salts per liter: 5 g  $\text{KNO}_3$ , 2.5 g  $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ , 1.25 g  $\text{KH}_2\text{PO}_4$ , 1.2 mg  $\text{Fe}^{+2}$ , and microelements as prescribed by Arnon. The Chlorella was cultured in a closed-air cultivator which contained

Card 1/8

L 14254-66

ACC NR: AT6003909

3—5% CO<sub>2</sub>. A temperature of 39—40° C was maintained, and the suspension was illuminated around the clock.

When Chlorella was cultivated without additional corrections to the medium, the pH shifted from 6.6 to 8.8 or even to 9.0. However this did not affect the rate of growth, which was from 0.5—0.6 billion cells per ml per diem. In a number of experiments the pH was corrected by means of nitric acid so that it remained between 6 and 7, thus preventing magnesium and phosphorus from precipitating out as more or less insoluble salts. During the process of cultivation concentrations of elements varied within the following limits:- nitrogen, 0.70—0.05 g/liter; phosphorus, 0.30—0.10 g/liter; sulfur, 0.32—0.22 g/liter; calcium, 2.3—2.15 g/liter; magnesium, 0.24—0.18 g/liter; and iron, 0.0012—0.0001 g/liter. The elements composing the biomass of Chlorella obtained in various experiments are shown in Table 1.

Card 2/8

ACC NR: AT6003909

Table 1. Chemical elements composing the biomass of  
Chlorella (in % of dry weight)

No. of experiment	N	P	S	K	Mg	Fe
1	7.87	1.80	1.07	1.50	0.68	0.01
2	7.70	1.80	1.18	1.68	0.68	0.03
3	8.20	1.70	1.06	1.60	0.55	0.02
4	8.20	1.65	—	1.63	0.48	0.05
5	—	1.76	1.19	—	—	—
Average	8.00±0.21	1.74±0.05	1.12±0.06	1.60±0.05	0.57±0.03	0.03±0.01

As Table 1 shows, the amounts of nitrogen, phosphorus, sulfur, and calcium remain relatively stable, deviating within a limit of 7%. The magnesium content was relatively stable, although it sometimes deviated by as much as 20%. The most variable element was iron. The data obtained on the chemical composition of Chlorella grown in Tamiya medium made it possible to estimate the amount of corrective additions to the medium nec-

L 14254-66

ACC NR: AT6003909

cessary for prolonged cultivation of *Chlorella pyrenoidosa* S-39. The amount of nitrogen removed from the medium and its accumulation in the composition of the biomass of Chlorella is shown in Table 2.

L 14254-66

ACC NR: AT6003909

A comparison of the amounts of nitrogen removed from the medium and its accumulation in the biomass indicate that the difference between the two is very small, varying from 3.5 to 7%. Table 3 shows the amounts of magnesium and phosphorus removed from the medium.

A removal of magnesium in different experiments is quite unstable and varies by as much as 23% from the average amount; the removal of phosphorus is much more stable.

Table 4 shows the absolute amounts of microelements of mineral nutrition which must be added to the solution for correcting the medium during the cultivation of Chlorella pyrenoidosa S-39, as well as molar and weight relationships between these elements. Table 4 also shows that Chlorella requires a comparatively large amount of nitrogen.

Card 6/8

Abstract: Chicken embryos (CE) (7 days old) were infected in the allantoic cavity with serum of patients with psoriasis, with serum or liquid of the bladder

Card 1/3

22

From patients with psoriasis and Darinia's dermatitis, and then incubated at 26 to 28 degrees. There was observed an accumulation of antibodies in the allantoic liquid of the infected CE on the fourth day. In CE infected with psoriasis a week accumulation was noted. In addition, of elementary bodies. During passing (4 passages), the antigenic properties of allantoic liquid decreased. Direct and crossed experiments of CPH (complement fixation reaction) with antisera and serums of patients permitted the establishment of a group proximity of antibodies of the group of diseases studied. In serums of healthy appearing members of families in which psoriasis was observed, specific complement fixation antibodies were found and on antigen,

TITLE:

Properties of the Alloys of the Ternary System Nickel  
Chromium<sup>71</sup>-Tungsten<sup>71</sup>

PERIODICAL:

Zhurnal neorganicheskoy khimii, 1960, Vol 5, Nr 2, pp 415-420  
(USSR)

ABSTRACT:

The authors investigated the electrical resistivity, hardness, and heat hardness after various heat treatments, of 32 alloys of the system Ni - Cr - W containing 5, 10, 20, and 30% W and 2, 5, 10, 15, 20, 25, 30, and 35% Cr. The alloys were smelted in a high-frequency furnace under a layer of basic slag. Thus, an oxidizing loss of Cr and W was avoided, as is shown by the analyses (Table 1). The test samples were partly annealed for 24 hr. at 1200°, and partly for 100 hr. at 1000°. Then the one series was hardened, and the other annealed another 100 hr. at 800°. The specific electric resistivity and its temperature coefficient were measured at 20 and 100° (Table 2, Figs 1-3). The resistivity in hardened alloys has its peak value at 5% W and 35% Cr. In annealed alloys this peak is shifted to lower Cr contents. These data confirm the changing

Card 1/2

B004/B006

solubility of Cr and W in the ternary solid Ni-solution. The hardness of the alloys was determined by means of an apparatus type TP (Table 3). An increasing Cr-content in the solid Ni solution leads to a continuous increase in hardness. Alloys with varying Cr- and Ni-contents are compared in table 4. An increasing W-content causes a sharper increase in the hardness of the alloys than an equal increase of the Cr-content. Heat hardness was measured between 100 and 1000° at intervals of 100° by means of the VIM-1 apparatus (designer M. G. Lozinskii) (Table 5, Fig 4). At constant W-contents and increasing Cr-contents hardness decreases with increasing temperature. Table 6 shows the change in heat hardness of an alloy containing 25% Cr and varying W-content. Under these conditions the alloys are more strengthened by W than by Cr. There are 4 figures, 6 tables, and 1 Soviet reference.

TITLE: On the investigation of the Ti-Nb system and its application in the Ti-Nb system  
PERIODICAL: Anzhurnal Tekhnicheskoy Kibernetiki, No. 1, 1968, p. 101-104.  
JOURNAL OF COMPUTER TECHNOLOGY, No. 1, 1968.

TEXT: The present work deals with an investigation of the Ti-Nb system and had the object of improving the properties of the alloys of the Ti-Nb system in the range of 40-60% Nb. Alloys were arc-melted in a cooled copper mould, with a tungsten-tungsten electrode, under an argon atmosphere. Grade FG-00 (99.62% pure electrothermic titanium (impurities C, 0.15% Fe, 0.05 Si, 0.05 C, 0.06 Mg, 0.10 O<sub>2</sub>, 0.01 N<sub>2</sub>, 0.05 N<sub>2</sub>, 0.03 N<sub>2</sub>) and 99.37% pure niobium (impurities C, 0.5% Ta, 0.09 Ti, 0.05 Fe, 0.09 Si, 0.05 C, B < 5 x 10<sup>-5</sup>) were used. Alloys were annealed in double quartz capsules at 1500°C for 6 hours at a pressure of 10<sup>-4</sup> mm Hg. Two parallel batches of alloys were then annealed.

Card 1/2

Investigation of ...

at 1 100 °C for 50 hours, and at 1 000 °C for 100 hours. One batch was water-quenched, the other slowly cooled to room temperature. The eight alloys prepared had the following Ti contents (weight %): 12.0, 21.8, 24.3, 25.3, 26.8, 33.0, 53.0 and 60.0. Microstructures, hardness and X-ray patterns (copper electrode, nickel filter) were studied. All the alloys were solid solutions. No metallic compound of the type TiNb was found, the second phase previously reported (Ref. 3 - V. P. Yelyutin, M. L. Beriushcheva and Yu. A. Pavlov - Dokl. Ak. nauk, SSSR, 1955, v. 104, no. 9) being, as shown by special experiments with Ti-Nb alloys containing up to 0.3% C, a solid solution of titanium and niobium carbides.

There are 12 figures, 2 tables, and 4 Soviet Union references.

TITLE: Phase diagram of the quaternary system nickel - chromium - tungsten - aluminum at 1100°C

PERIODICAL: Zhurnal neorganicheskoy khimii, v. 6, no. 11, 1961, 2607-2609

TEXT: Part of the system Ni-Cr-W-Al (up to 40 % of Cr and 30 % of W + Al), and the properties of these alloys were studied in the present paper. Three tetrahedral sections of the system were examined. Ratios: W : Al = 3 : 1 (I); 1 : 1 (II); and 1 : 3 (III). The alloys were molten from electrolytic Ni, Cr, W, and A-000 (A-000) aluminum. Al was introduced into the melt as NiAl (29 % of Al). The alloys were subjected to various kinds of heat treatment. For 50 hr they were kept at 1100°C, then the first sample was chilled whereas the others were kept at 1000°C for another 100 hr. Then, the second sample was chilled, samples 3 and 4 were kept at 800°C for 250 hr. Sample 3 was chilled and sample 4 cooled down to room temperature within 24 hr. Since homogeneity was not attained homogenizing annealing followed at 1300-1350°C in a TBB-2M (TVV-2M) X

Phase diagram of the quaternary...

furnace. The diagrams of Fig. 2 were plotted for the three sections on the basis of their microstructures and powder patterns. An X-ray analysis of the quaternary solid nickel solution of section I showed that an increase of the Cr content from 10 to 40 % increased the lattice constants of the solid solution from 3.55 to 3.62 kX; an increase of the total W + Al content from 10 to 40 % at a constant Cr content changed the lattice constant from 3.55 to 3.56 - 3.57 kX. The thermal resistivity of the alloys was tested by a method involving centrifuging at 850-900°C and  $10-15 \text{ kg/mm}^2$ . At 900°C and under a load of  $10 \text{ kg/mm}^2$ , the alloy with 10 % of Cr, 22.5 % of W and 7.5 % of Al showed a 4 mm deformation after 160 hr. The alloy containing 10 % of Cr, 15 % of W and 5 % of Al underwent 6 mm deformation under the same conditions. The thermal resistivity was tested at 1100°C. Considerable softening of all alloys occurred between 700 and 800°C. With increased Al content it was shifted toward higher temperatures. There are 2 figures, 1 table, and 3 references: 2 Soviet and 1 non-Soviet. The reference to the English-language publication reads as follows: A. Taylor, R. W. Floyd, J. Inst. Metals, 81, 451 (1952/53). X

TEXT: Isothermal sections (1100°C) representing Ni-Cr-W-Al alloys with fixed W:Al wt. ratios (3:1, 1:1, 1:3) were prepared on the basis of x-ray, microstructural, and chemical analyses of the quaternary alloys containing up to 50% Cr and up to 50% W+Al. The  $\gamma'$ -phase (Ni-based solid solution) is predominant in the alloys with a 3:1 W:Al ration; a three-phase region ( $\gamma + \beta + \alpha_2$ ) exists in the alloys containing over 40% W+Al,  $\beta$  being a NiAl-based and  $\alpha_2$  a W-based solid solution. The alloys with a 1:1 W:Al ratio are characterized by a narrower  $\gamma$  region and by three 3-phase regions:  $\gamma + \beta + \alpha_1$ ,  $\gamma' + \beta + \alpha_1$ , and  $\gamma + \gamma' + \beta$ ,  $\alpha$  being a Cr-based and  $\gamma'$  a Ni<sub>3</sub>Al-based solid solution. Alloys with a 1:3 W:Al ratio are

Investigation of alloys...

characterized by an even narrower  $\gamma'$  -region and by the appearance of homogenous  $\gamma'$  and  $\beta$  regions. The lattice parameter of the  $\gamma$  -phase in the 3:1 W:Al alloys increases with the Cr content, from 3.55 kX at 10% Cr to 3.62 kX at 40%Cr; variations in the W+Al content have a negligible effect on this parameter. The solubility of W+Al in the  $\gamma$  -phase is 35, 15, and 10% in the 3:1, 1:1, and 1:3 W:Al alloys respectively. Many alloys within the systems studied exhibited fair refractory properties when subjected to centrifugal tests at 850-900°C; alloys with increased Al content retain their hardness at even higher temperatures. There are 4 figures and 1 table.

the results of the thermal and x-ray diffraction analyses, the phase diagram (see illustration) of the system was plotted. Over the entire concentration range, TiCr<sub>2</sub> and NbCr<sub>2</sub> form a continuous series of solid solutions not only between the high-temperature modifications  $\delta$ , but also between the low-temperature modifications  $\gamma$ . The  $\gamma$ - $\delta$  transformation temperatures for TiCr<sub>2</sub> and NbCr<sub>2</sub> were determined as  $1220 \pm 10^\circ\text{C}$  and  $1585 \pm 10^\circ\text{C}$ , respectively. On the TiCr<sub>2</sub> side the  $\beta$ ,  $\beta + \delta$ ,  $\beta + \text{L}$ , and  $\beta + \delta + \text{L}$  regions are present, since the TiCr<sub>2</sub> compound in the binary Ti-Cr system is formed from a solid solution with a bcc lattice (the  $\beta$ -phase). X-ray diffraction patterns of alloys quenched from  $1300^\circ\text{C}$  showed that at

TiCr<sub>2</sub>-NbCr<sub>2</sub> SYSTEM [Cont'd]

8/20/63/149/006/017/027

TiCr<sub>2</sub> + 10% NbCr<sub>2</sub> alloy consists of hexagonal  $\delta$  and cubic  $\gamma$  modifications. Alloys with more than 20% NbCr<sub>2</sub>, as well as the NbCr<sub>2</sub> compound, consist only of the cubic  $\gamma$ -phase. In alloys annealed at 1000°C for 200 hrs, only the  $\gamma$ -phase was found. Thus, the TiCr<sub>2</sub>-NbCr<sub>2</sub> system can be regarded as a quasi-binary section of the ternary Ti-Nb-Cr system up to 1340°C, when decomposition of the TiCr<sub>2</sub> compound to a solid solution of Ti and Cr occurs.

TITLE: Investigation of ternary titanium-niobium-chromium alloys

SOURCE: AN SSSR. Institut metallurgii. Titan i yego splavy\*, no. 10, 1963.  
Issledovaniya titanovykh splavov, 37-41

TOPIC TAGS: titanium ternary alloy, titanium chromium niobium alloy, titanium alloy, alloy structure, titanium chromium niobium system

ABSTRACT: The cross sections of the ternary system Ti-Nb-Cr corresponding to Ti:Nb = 4:1, 3:2, 2:3 and 1:4, as well as the compounds  $TiC_2$ - $NbCr_2$ , have been studied by means of microstructure analysis and X-ray diffraction. The specimens were annealed in argon at temperatures of 1300-1500 C for 60-70 hours (alloys rich in Ti) and up to 240 hours (alloys rich in Nb and Cr). The specimens were then hardened at 1000, 800, and 600 C. The microstructures as determined by the common etching methods are shown in the original. On the basis of the X-ray and microstructure data, isothermal cross sections in alloys hardened at 1000, 800, and 600 C were constructed and are shown in Figure 1 of the Enclosure. The basic area of the figure for alloys hardened at 1000 C consists of a mixture of the  $\beta$  and  $\gamma$  solid solutions, representing the solid solution of the compounds

Card 1/3

ACCESSION NR: AT4007025

(TiNb)Cr<sub>2</sub>. The area of the  $\beta$  solid solution is gradually reduced as the content of Nb in the alloys is increased. The phase distribution in the isothermal cross section at a hardening temperature of 800 C did not differ from the isothermal cross section at 1000 C, except that a biphasic area of  $\alpha$  +  $\beta$  phases was found in the Ti corner. In the 600 C cross section of the ternary system, a large area of  $\alpha$  +  $\beta$  +  $\gamma$  phases is formed which borders on the biphasic areas  $\alpha$  +  $\beta$ ,  $\alpha$  +  $\gamma$ , and  $\beta$  +  $\gamma$ . Monophasic alloys exist only in the area with Nb content above 50%. The changes in lattice periods corresponding to the individual phases are also shown. Orig. art. has: 5 figures.

ABSTRACT: The stability of the interatomic bond in the crystal lattice of metals and alloys is characterized by the heats of sublimation, melting and dissolution, elasticity constants, the mean distribution of atoms in the lattice and other parameters. The present paper investigates the forces of interatomic bonding in monophasic Ti-Nb-Cr alloys. The elasticity constants of the  $\beta$  and  $\gamma$  alloys were determined on the "Elastomat" unit with an accuracy of 1-1.5% after quenching from 1000°C with Ti:Nb = 4:1, 3:2, 2:3 or 1:4. All alloys with 50% Cr, where the  $\gamma$ -phase is predominant, show a modulus of normal elasticity of the solid solution

Card 1/2

L 15670-65

which is much higher than for the pure components of the  $\beta$ -phase. The values of the mean distribution of atoms were calculated by the Debye-Weller equation. The tests showed that niobium has less of an effect on the forces of interatomic bonding than chromium. Chromium is very important for increasing the strength as the temperature rises. The tests also indicated that increasing the niobium content in the  $\chi$ -solid solution leads to proportional increases in the characteristic temperature and bonding strength in the  $\chi$ -phase lattice. These conclusions were verified by tests at high temperatures. By analyzing the data on the variation in hot strength of the alloys it can be seen that monophasic  $\beta$ -solid solutions are weakened more rapidly than  $\chi$ -phase alloys. The results also corroborate previous conclusions from the analysis of atomic distribution at 0 and 293K. Although chromium is most effective for hardening  $\beta$ -solid solutions, niobium is important for hardening the  $\chi$ -phase. "S. G. Fedotov assisted in the determination of the elastic constants." Orig. art. has: 3 figures, 5 formulas and 3 tables.
